Monitoring

Configuring Web Services in SOA Manager - SAP Help Portal
Web services communicate over a network through HTTP between the two systems. Many web services are identical to SOA (Services Oriented Architecture) and mainly rely on standards such as XML-RPC and SOAP (Simple Object Access Protocol). Example: The application A provides the function allowing other applications to get the information of a user via the URL: " abc.com/user/id ". The input is the id and the output is the user information.

6 Differences between Web Services vs API (SOAP & REST ...
SOAP is a protocol. SOAP was designed with a specification. It includes a WSDL file which has the required information on what the web service does in addition to the location of the web service. REST is an Architectural style in which a web service can only be treated as a RESTful service if it follows the constraints of being ; Client Server; Stateless

SOAP Vs. REST: Difference between Web API Services
There are significant differences between SOAP and RESTful web services. The bullets below break down the features of each web service based on personal experience. REST. RESTful web services are stateless. You can test this condition by restarting the server and checking if interactions survive.

REST vs. SOAP: Choosing the best web service
While SOAP and REST share similarities over the HTTP protocol, SOAP is a more rigid set of messaging patterns than REST. The rules in SOAP are important because we can't achieve any level of standardization without them. REST as an architecture style does not require processing and is naturally more flexible.

Understanding SOAP vs REST: Basics And Differences
Setting up the connection to the Services Registry, configuring publication rules, publishing service definitions. Accessing and Testing a Service. Check that a service is functioning correctly and find the URL of the configured service. Logs and Traces. Manage and configure logs and traces for Web service provider and consumer calls. Monitoring
